USE OF N-SUBSTITUTED AZAHETEROCYCLIC COMPOUNDS FOR THE MANUFACTURE OF A PHARMACEUTICAL COMPOSITION FOR THE TREATMENT OF INDICATIONS RELATED TO ANGIOGENESIS

FIELD OF INVENTION

The present invention relates to the use of N-substituted azaheterocyclic compounds of the general formulas Ia-Id for the treatment, prevention, alleviation or amelioration of conditions related to angiogenesis. Hence the compounds can be used in the treatment of patients suffering from a variety of diseases like abnormal tissue growth, neoplasia, hyperplasia, cancer, diabetic retinopathy. The present invention also embraces pharmaceutical compositions comprising those compounds and methods of using the compounds and their pharmaceutical compositions.

BACKGROUND OF INVENTION

Tissue growth is critically dependent upon the formation of new capillaries, called angiogenesis or neovacularisation. The process may in pathological conditions be turned on by growth factors, e.g. vascular endothelial growth factor or cytokines, e.g. tumor necosis factor α. In e.g. cancer, angiogenesis is an important factor for the maintenance and growth of the tumor (Tanaka et al., Cancer Res., 58, 3362-3369, 1998). Angiogenesis is important for neoplastic conditions like cancer as well as ocular neovascularization like diabetic retinopathy (Favard et al., Diabetes and Metabolism 22 , 268-273, 1996) . . Thus it has been shown that treatments directed against angiogenesis can e.g. inhibit tumor growth (Folkman, J., Breast Cancer Res. and Treat., 36, 190-118, 1995, Tanaka et al.,Cancer Res., 58, 3362-3369, 1998). The fact that angiogenesis is prominent in the female reproductive system suggests that treatments against angiogenesis are important for several conditions like bleeding disorders or in the context of birth control (Pepper, Arteriosclerosis, Thrombosis, and Vascular Biology 17:605-619, 1997).

Thus one object of the invention is to provide compounds which can be used in the treatment of patients suffering from diseases in which neovascularisation or angiogenesis prevails or for the control of normal angiogenesis to obtain e.g. birth control.

WO 9518793 discloses N-substituted azaheterocyclic carboxylic acids and esters thereof, methods for their preparation, compositions containing them and their use in treatment of hyperalgesic and/or inflammatory conditions.

It has been demonstrated that the compounds of the present the invention can be used in the treatment of conditions related to angiogenesis according to the following experiment.

PHARMACOLOGICAL METHODS

The effects of compounds of formulas Ia-Id on angiogenesis are suggested by the following experiments. Air pouches were formed on the dorsum of female To mice and were inflamed one day later by injection of 0.5 ml Freund's complete adjuvant supplemented with 0.1% croton oil. Animals were dosed with compounds of formulas Ia-Id given via the drinking water equivalent to 3-30 mg/kg/day. Control animals received normal drinking water. After 6 days the animals received an injection of carmine in gelatine intravenously prior to dissection of the air pouch granuloma. Comparisons of granuloma dry weight, carmine content and vascular index (carmine content/granuloma dry weight) were made between the groups (Colville-Nash et al., J. Pharmacol. Exp. Ther. 274 1463-1472, 1995).

Treatment with compounds of formulas Ia-Id during 6 days gave reductions in the vascular index between 27-36%

Neovascularization in mouse corneas was induced by surgical implantation of a micropellet containing VEGF (vascular endothelial growth factor) or FGF (fibroblast growth factor) 0.6-0.8mm from the corneal limbus. Animals were dosed with compounds of formulas Ia-Id given via the drinking water equivalent to 15 mg/kg/day. After 5 days the stimulation of new blood vessel growth was examined by measuring the vessel length and vessel area (Cao et al., J. Clin. Invest. 98, 2507-2511, 1996).

Treatment with compounds of formulas Ia-Id resulted in a decrease of the vessel area of neovascularization of 30-50%.

PHARMACEUTICAL COMPOSITIONS

The present invention also relates to pharmaceutical compositions comprising, as an active ingredient, at least one of the compounds according to the invention or a pharmaceutically acceptable salt thereof and, usually, such compositions also contain a pharmaceutically acceptable carrier or diluent.

Pharmaceutical compositions comprising a compound of the present invention may be prepared by conventional techniques, e.g. as described in Remington: The Science and

Practise of Pharmacy, 19th Ed., 1995. The compositions may appear in conventional forms, for example capsules, tablets, aerosols, solutions, suspensions or topical applications.

Typical compositions include a compound according to the invention or a pharmaceutically acceptable acid addition salt thereof, associated with a pharmaceutically acceptable excipient which may be a carrier or a diluent or be diluted by a carrier, or enclosed within a carrier which can be in the form of a capsule, sachet, paper or other container. In making the compositions, conventional techniques for the preparation of pharmaceutical compositions may be used. For example, the active compound will usually be mixed with a carrier, or diluted by a carrier, or enclosed within a carrier which may be in the form of a ampoule, capsule, sachet, paper, or other container. When the carrier serves as a diluent, it may be solid, semi-solid, or liquid material which acts as a vehicle, excipient, or medium for the active compound. The active compound can be adsorbed on a granular solid container for example in a sachet. Some examples of suitable carriers are water, salt solutions, alcohols, polyethylene glycols, polyhydroxyethoxylated castor oil, syrup, peanut oil, olive oil, gelatine, lactose, terra alba, sucrose, cyclodextrin, amylose, magnesium stearate, talc, gelatin, agar, pectin, acacia, stearic acid or lower alkyl ethers of cellulose, silicic acid, fatty acids, fatty acid amines, fatty acid monoglycerides and diglycerides, pentaerythritol fatty acid esters, polyoxyethylene, hydroxymethylcellulose and polyvinylpyrrolidone. Similarly, the carrier or diluent may include any sustained release material known in the art, such as glyceryl monostearate or glyceryl distearate, alone or mixed with a wax. The formulations may also include wetting agents, emulsifying and suspending agents, preserving agents, sweetening agents or flavouring agents. The formulations of the invention may be formulated so as to provide quick, sustained, or delayed release of the active ingredient after administration to the patient by employing procedures well known in the art.

The pharmaceutical compositions can be sterilized and mixed, if desired, with auxiliary agents, emulsifiers, salt for influencing osmotic pressure, buffers and/or colouring substances and the like, which do not deleteriously react with the active compounds.

The route of administration may be any route, which effectively transports the active compound to the appropriate or desired site of action, such as oral, nasal, pulmonary, transdermal or parenteral e.g. rectal, depot, subcutaneous, intravenous, intraurethral, intramuscular, topical, intranasal, ophthalmic solution or an ointment, the oral route being preferred.

If a solid carrier is used for oral administration, the preparation may be tabletted, placed in a hard gelatin capsule in powder or pellet form or it can be in the form of a troche or lozenge. If a liquid carrier is used, the preparation may be in the form of a syrup, emulsion, soft gelatin capsule or sterile injectable liquid such as an aqueous or non-aqueous liquid suspension or solution.

For nasal administration, the preparation may contain a compound according to the invention dissolved or suspended in a liquid carrier, in particular an aqueous carrier, for aerosol application. The carrier may contain additives such as solubilizing agents, e.g. propylene glycol, surfactants, absorption enhancers such as lecithin (phosphatidylcholine) or cyclodextrin, or preservatives such as parabenes.

For parenteral application, particularly suitable are injectable solutions or suspensions, preferably aqueous solutions with the active compound dissolved in polyhydroxylated castor oil.

Tablets, dragees, or capsules having talc and/or a carbohydrate carrier or binder or the like are particularly suitable for oral application. Preferable carriers for tablets, dragees, or capsules include lactose, corn starch, and/or potato starch. A syrup or elixir can be used in cases where a sweetened vehicle can be employed.

A typical tablet which may be prepared by conventional tabletting techniques may contain:

Core:	
Active compound (as free compound or salt thereof)	100 mg
Colloidal silicon dioxide (Aerosil)	1.5 mg
Cellulose, microcryst. (Avicel)	70 g
Modified cellulose gum (Ac-Di-Sol)	7.5 mg
Magnesium stearate	
Coating:	
HPMC approx.	9 mg
*Mywacett 9-40 T approx.	0.9 mg

*Acylated monoglyceride used as plasticizer for film coating.

The compounds of the invention may be administered to a mammal, especially a human in need of such treatment, prevention, elimination, alleviation or amelioration of indications related to angiogenesis. Such mammals include also animals, both domestic animals, e.g. household pets, and non-domestic animals such as wildlife.

The compounds of the invention may be administered in the form of an alkali metal or earth alkali metal salt thereof, concurrently, simultaneously, or together with a pharmaceutically acceptable carrier or diluent, especially and preferably in the form of a pharmaceutical composition thereof, in an effective amount.

The compounds of the invention are effective over a wide dosage range. For example, in the treatment of humans, dosages from about 0.1 to about 1000 mg, preferably from about 0.5 to about 500 mg of compounds of formula I, conveniently given from 1 to 5 times daily. A most preferable dosage is from about 50 to about 200 mg per dose when administered to e.g. a human. The exact dosage will depend upon the mode of administration, on the therapy desired, form in which administered, the subject to be treated and the body weight of the subject to be treated, and the preference and experience of the physician or veterinarian in charge.

Generally, the compounds of the present invention are dispensed in unit dosage form comprising from about 50 to about 200 mg of active ingredient in or together with a pharmaceutically acceptable carrier per unit dosage.

Usually, dosage forms suitable for oral, nasal, pulmonal or transdermal administration comprise from about 0.1 mg to about 1000 mg, preferably from about 0.5 mg to about 500 mg of the compounds according to the invention admixed with a pharmaceutically acceptable carrier or diluent.

The method of treating may be described as the treatment, prevention, elimination, alleviation or amelioration of a condition related to angiogenesis in a subject in need thereof, which comprises the step of administering to the said subject an effective amount of a compound of the invention, or a pharmaceutically acceptable salt thereof.

Any novel feature or combination of features described herein is considered essential to this invention.
